

# A GLOBAL GREEN FUND TO MANAGE CHEMICALS AND WASTE

Donor countries cannot continue to subsidize the profits of the chemical industry by using public funds to clean up the industry's mess.

- To finance the sound management of chemicals and wastes, **governments need an adequate, predictable, and sustainable financing mechanism.**
- This mechanism should be based on the **internalization of costs of chemical and waste industries.**
- A 0.1% levy on global chemical industry sales would generate **USD\$5.7 billion per year** for implementing chemical safety measures.

## The Orphan Planetary Crisis: No Funds for Managing Chemicals and Waste

A “triple planetary crisis” has been identified, with global threats from climate change, biodiversity loss, and pollution from chemicals and waste.

Countries have committed to funds to address threats from the first two under UN global agreements:

- Green Climate Fund: \$100 Billion USD per year target by 2020
- Global Biodiversity Fund: \$30 Billion USD per year by 2030 from developed to developing countries

**Chemicals and Waste: No Funding**

**A Global Green Chemicals and Waste Fund  
is urgently needed!**
